

Proposal for Emoji: Kidney

Submitter: Shuhan He; Edgar Lerma; Caitlyn Vlasschaert; Jade M. Teakell; Harish Seethapathy; Danielle Miller; Timur Erk; Lauren Beaudin; Heena Purohit (Microsoft for Startups); David Rhew, MD (Chief Medical Officer, Microsoft)

Main point of contact: Shuhan He

Date: 2026-07-28

Identification

Suggested name: Kidney

Suggested keywords: renal; anatomy; organ; filtration; urine; dialysis; transplant; donation; stone; kidney test

Suggested category: People & Body - body-parts

Suggested sort location: Near anatomical heart, lungs, and brain in the body-parts subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

I, Shuhan He, certify that these example images are original work created for this proposal, that I own all IP Rights in them, and that they contain no third-party artwork, logo, trademark, or text. I release the images under the CC0 1.0 Universal Public Domain Dedication and grant the rights required by the Unicode Emoji Proposal Agreement and License.

[CC0 1.0 Universal Public Domain Dedication](#)

Factors for Inclusion

A. Multiple meanings

Beyond the organ, kidney-shaped is an established shape descriptor in ordinary non-medical English. It names a recognized form in furniture and landscape design: kidney tables, kidney desks,

kidney trays, and kidney-shaped swimming pools. Retail and design catalogues use the term as a primary product category rather than as a figure of speech; see [1stDibs kidney-shaped tables](#) and [Houzz kidney-shaped pools](#).

This sense is not marginal relative to the literal ones the proposal relies on. In the English Google Books corpus, `kidney-shaped` reaches a higher historical peak than `kidney stone` and remains at roughly two-thirds of its 2022 level. [Open the reproducible Google Books Ngram query](#).

A Kidney character therefore carries an organ sense and a widely used shape sense. The shape sense is offered as an additional meaning, not as the basis for encoding.

B. Use in sequences

Two short combinations express established phrases:

- Kidney + rock: `kidney stone`.
- Kidney + test tube: `kidney tests` or `kidney function tests`.

MedlinePlus uses `kidney stone analysis` for a patient collecting a passed stone for a provider or laboratory, and lists `kidney tests`, `kidney function tests`, and `kidney panel` as established names for blood, urine, and imaging checks. See [Kidney Stone Analysis](#) and [Kidney Tests](#).

C. Breaks new ground

Yes. The [current Unicode Emoji List](#) has no Kidney character. Beans is the closest encoded pictograph, and Unicode even includes `kidney` among its search keywords; however, its CLDR name is `beans` and it remains a Food & Drink pictograph. Generic medical emoji add care or testing but do not supply the missing literal organ. See the [Unicode Emoji List](#).

D. Distinctiveness

Kidney is shown as two maroon, inward-facing forms with visible medial notches and a clear diagonal offset. The polished 72-pixel example adds restrained shading and the renal vessels; the purpose-built 18-pixel example keeps only the two solid notched bodies and the offset, which are the cues that survive at that size. Those cues distinguish it from separate Beans and from the symmetric lobes and top-entering airway of Lungs. Vendors may vary color, shading, and fine anatomical detail while preserving the paired notched bodies and the offset.

E. Expected usage level

The most direct evidence of expected usage is that people already send a kidney pictograph. Lacking a Kidney character, writers substitute Beans: third-party emoji reference sites index Beans combinations under kidney and nephrology headings, and practitioners report that the substitution is confusing in the context of kidney disease. That is demand expressed pictographically rather than

inferred from word counts, and it is the exhibit this factor rests on first. See [Kidney emoji combinations](#) and [The Case for a Kidney Emoji](#).

Kidney supplies the missing noun in ordinary messages about a stone, test results, dialysis, a transplant, or living donation. U.S. patient guidance uses the exact phrases `kidney stone`, `kidney tests`, `kidney transplant`, and `donate a kidney`; U.K. guidance likewise uses `kidney transplant tests` and explains dialysis when kidneys can no longer filter normally. These are concrete situations in which people collect a stone, discuss results, prepare for treatment, or donate or receive an organ; this is not an argument from medical importance. See [Kidney Stone Analysis](#), [Kidney Tests](#), [Kidney Transplant](#), [Living Donation](#), [Kidney Transplant Tests](#), and [Dialysis](#).

The five required frequency exhibits below test the unfiltered term `kidney`; Google Trends and Google Books compare it with `elephant`. They are offered as supporting context rather than as the primary case. The unfiltered term also captures `kidney bean` and disease-related pages, so these counts establish sustained term visibility only, not medical importance or guaranteed emoji use.

AI Overview

Kidneys are **two bean-shaped organs, about the size of a fist, located on either side of the spine just below the rib cage.** They filter roughly 37 gallons of blood daily to remove waste and extra water, maintaining fluid, salt, and mineral balance while producing urine. Key functions also include regulating blood pressure, stimulating red blood cell production, and managing bone health. [Cleveland Clinic](#) +4

Key Kidney Functions & Health

- Filtration:** Using millions of tiny units called nephrons, kidneys filter waste and excess water from the blood, which then travels to the bladder through ureters.

F. Completeness

Not applicable. Internal organs are not a fixed set.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already representable

Beans is the strongest existing single emoji, and it is already being used this way. Unicode's own `kidney` keyword makes it searchable, and writers who need the organ reach for it in the absence of anything better. Third-party emoji reference sites independently index Beans combinations under kidney and nephrology headings; see [Kidney emoji combinations](#) and [Nephrology emoji](#). A 2022 editorial in the American Journal of Kidney Diseases describes Beans as among the best available alternatives and reports that it is confusing when used in the context of kidney disease; several authors of that editorial are also submitters here, so it is offered as practitioner testimony rather than independent measurement. See [The Case for a Kidney Emoji](#).

That is the substance of this factor. The question is not whether a substitute can be improvised; it is whether the improvisation works. Beans is named `beans`, is categorized under Food & Drink, and displays food. Beans + Hospital can suggest kidney care but can equally read as food, diet, or beans at a hospital. Beans + Rock does not clearly name `kidney stone`, and Beans + Test Tube does not clearly name `kidney tests`; in each case the reader must first assume that Beans means an organ. Observed substitution shows the need; the recorded confusion shows the substitute does not meet it. A Kidney character supplies the missing noun. See the [Unicode Emoji List](#).

B. Overly specific

Kidney represents the organ generally. The same noun is used in kidney stone analysis, kidney testing, dialysis, transplantation, and living donation; it is not a specific disease, procedure, campaign, organization, or subtype.

C. Open-ended

The closest unencoded neighbors are Liver, Stomach, Pancreas, and Spleen. Kidney has a specific combination that those names cannot simply reuse: kidney stone and dialysis, together with kidney testing and donation/transplant language. Beans and short sequences still fail to identify the organ, the required frequency exhibits show sustained use of its name, and the paired notched form remains legible at small size. Kidney is not proposed because organs are important or because an

anatomy set should be completed; encoding it would not establish that every neighboring organ meets the same evidence.

D. Transient

Kidney is an established anatomical term rather than a campaign, event, or product. The embedded Google Books evidence spans 1500-2022, while current NIDDK, MedlinePlus, and HRSA guidance uses the same noun across testing, stones, dialysis, transplantation, and donation.

E. Faulty comparison

Existing organ emoji do not create an entitlement to Kidney. Lungs is used only as a small-size legibility comparison; the Kidney case rests on the named stone, testing, dialysis, transplant, and donation messages, the remaining ambiguity of Beans, the frequency evidence, and the paired notched pictograph.

Other Information

The singular name Kidney identifies the organ concept even though the example shows the familiar paired organs; this proposal does not request separate singular and plural characters. Vendors may vary color, shading, and fine anatomy while preserving two inward-facing notched bodies and a visible offset. Vascular anatomy is intentionally omitted from the 18x18 examples, where it does not survive, and retained in the 72x72 examples.
