

Medical Emoji — Insights & Post Kit for ACEP

Prepared for the American College of Emergency Physicians communications team to accompany a post — presented by the **ACEP Emergency Medicine Informatics Section** — about ACEP's June 5, 2026 letter of support for the Medical Emoji Project. Everything here is drafted to be lifted directly or adapted to ACEP's voice.

The drive-home point: ACEP is the first national, multi-specialty physician society to support the entire Medical Emoji effort at once — its letter of support names all ten concepts now in development. The emoji aim to give clinicians and patients a familiar, globally available visual layer for organ systems, infection, cardiac monitoring, transfusion, medication use, and weight-based care.

1. Background (2–3 sentences for the post)

The Medical Emoji Project advocates for adding high-utility medical symbols to the Unicode Standard, the global system behind the emoji on every phone. In 2019, emergency physician **Shuhan He, MD** (Massachusetts General Hospital) and collaborators helped win Unicode approval for the **anatomical heart**  **and lungs** , which shipped on billions of devices in 2021 and were documented in *JAMA*. The project is now pursuing ten further concepts — and ACEP has now written a letter in support of that work.

2. Why ACEP's letter of support matters

- It is a **clinical and professional letter of support from a national society**, the kind of broad-applicability signal Unicode weighs when evaluating proposals.
- It covers **all ten current concepts at once**, rather than a single organ — a first for the project.
- It frames medical emoji where emergency medicine lives: **clear communication under time pressure, across languages, literacy levels, ages, and disabilities** — for patient education, discharge instructions, public health messaging, and medical education.
- ACEP is explicit that these symbols **add to**, and do not replace, clinical language or professional interpretation.

3. The ten concepts ACEP named (with a clinical hook for each)

Use any subset. Each pairs a concept with a fact that lands quickly.

Concept	Why it matters
Liver	Liver disease causes ~2 million deaths a year worldwide; ~25% of Americans have non-alcoholic fatty liver disease.
Kidney	Chronic kidney disease affects ~10% of the global population.
Stomach	GERD carries an estimated \$18B in direct and \$75B in indirect costs annually.
Intestine / Bowel	Colorectal cancer is the 3rd most diagnosed cancer and 2nd leading cause of cancer death.
White Blood Cell	Infection and immunity shaped history from the Black Plague to COVID-19; 15.5M U.S. primary-care visits for infectious disease in 2016.
ECG / EKG	One person dies every 36 seconds from cardiovascular disease in the U.S.
Spine	Low back pain is the #1 cause of years lived with disability worldwide.
Blood Product	Every 2 seconds, someone in the U.S. needs blood.
Pill Pack	~50,000 opioid overdose deaths in the U.S. in 2019.
Weight Scale	Over 2 billion people worldwide live with overweight or obesity.

4. How Unicode emoji approval works (one line of context)

Unicode reviews each proposal against published criteria — distinctiveness, expected usage, image licensing, and broad applicability — through a formal annual process. Society support speaks to clinical relevance and broad applicability.

X / Twitter (single post)

The American College of Emergency Physicians has issued a letter of support for the @medicalemoji project — for standardized medical emoji covering liver, kidney, stomach, bowel, white blood cell, ECG, spine, blood products, pill packs, and weight scales. Clearer health communication, on every device. 🫀 🫁

X / Twitter (thread opener, if going longer)

1/ ACEP has written in support of a push to add medical emoji to the global Unicode Standard — simple visual anchors for common clinical concepts that patients and clinicians can use across languages, literacy levels, and devices. Here's why it matters 🏥

LinkedIn / website post

ACEP supports standardized medical emoji

Emergency physicians communicate in time-sensitive settings where clarity matters across languages, literacy levels, ages, and abilities. The American College of Emergency Physicians has issued a letter of support for the Medical Emoji Project's work to add high-utility medical symbols to the Unicode Standard — the system behind the emoji on every phone.

The letter of support covers ten concepts: anatomical liver, kidney, stomach, intestine/bowel, white blood cell, ECG/EKG, spine, blood product, pill pack, and weight scale. These symbols would add a familiar, globally available communication layer for patient education, discharge instructions, public health messaging, and medical education — complementing, never replacing, clinical language.

The project's earlier work helped bring the anatomical heart 🫀 and lungs 🫁 to Unicode in 2021. Learn more: medicalemoji.org
