

Medical Emoji submission options

One indexed packet containing all 15 current working proposals

Current plan

CT Scan and Blood Bag are planned after revision. Pill Box is the first alternate. Unicode's published submission window closes July 31, 2026.

Options and page guide

The two-page decision brief begins on page 2

STATUS	CONCEPT	WHAT REMAINS	PAGE
PLANNED	CT Scan	Revise evidence, rights, metadata, and small-size artwork before filing	4
PLANNED	Blood Bag	Revise evidence and compare directly with IV Bag before filing	10
ALTERNATE	Pill Box	First alternate; refresh weak usage evidence and test against Pill	16
EVIDENCE	Ultrasound	Promising concept; required Google evidence remains incomplete	22
EVIDENCE	Weight Scale	Promising alternative; evidence and recognition work remains	27
REVIEW	Inhaler	Worth another look; evidence and worldwide-recognition case remain	32
DRAFT	White Blood Cell	Current-cycle draft with evidence and small-size recognition gaps	38
DRAFT	IV Bag	Missing Trends evidence; compare directly with Blood Bag	43
DRAFT	Leg Cast	Current-cycle draft; prior decline and recognition case need review	48
DRAFT	Pill Pack	Evidence, comparator, naming, and 18-pixel recognition problems	55
DRAFT	Maze	Current-cycle draft; missing Google evidence and prior declines	60
DRAFT	First Aid Kit	Current-cycle draft; missing Google evidence and substitute concerns	65
LATER CYCLE	Kidney	November 2022 decline remains inside the four-year bar	70
LATER CYCLE	Stomach	November 2022 decline remains inside the four-year bar	78
LATER CYCLE	Liver	November 2022 decline remains inside the four-year bar	85

WORKING MATERIALS - NOT FIFTEEN PROPOSED FILINGS

The packet supports comparison and routing. Every selected proposal still needs its own final review and official Unicode form submission.

Medical Emoji proposals for Microsoft review

Prepared: July 13, 2026 | Prepared by: Shuhan He

Purpose

I plan to submit **CT Scan** and **Blood Bag** through Unicode's 2026 emoji intake after updating their evidence and image-rights language. **Pill Box** is the first alternate. Unicode's published filing window closes July 31. That places this work late in the cycle, but still before the deadline.

This brief asks Microsoft for two kinds of help:

1. Review the proposal shortlist, artwork, evidence, and rights record.
2. Advise on the appropriate Unicode route for the individual proposals and for a separate discussion document about health-related emoji coverage.

Current filing plan

CT Scan. This is the strongest developed proposal. It includes exhibits in all five evidence categories and has a clearer independent use case than the existing X-Ray emoji. Before filing, I will recapture its 2020 Search, Video, and Trends evidence using the current method, test the 18-pixel image against MRI and generic scanners, and state the artwork ownership clearly.

Blood Bag. This proposal also includes the five required evidence exhibits. It supports donation, transfusion, blood-supply, and patient-care communication that a Drop of Blood cannot fully express. I will refresh the 2020 evidence and test the image beside IV Bag because the two silhouettes are similar in black and white.

Pill Box, as the first alternate. Pill Box has an exhibit in each evidence category and communicates weekly medication organization more clearly than Pill Pack. Its historical usage evidence is weak and must be refreshed. Reviewers may also conclude that the existing Pill emoji is sufficient. Even with those limitations, Pill Box is the strongest medication option in the current portfolio.

Before submitting, I will complete the evidence updates, current factor labels, artwork-ownership records, document meta-data, and small-size recognition checks.

Questions for Microsoft

1. Review and working-group timing

After I submit the selected proposal PDFs through Unicode's official Emoji Submission Form, would Microsoft's Unicode standards representatives be willing to ask the Emoji Standard & Research Working Group to consider adding them to an upcoming agenda as part of its normal review process?

Unicode will control the agenda, review, and outcome. I am asking for Microsoft's technical review and help bringing these proposals to the working group's attention.

2. Separate UTC discussion document

The attached **Health-related emoji coverage** paper is now written as a final UTC submission document and names David Rhew, Heena Purohit, and Shuhan He as authors. Would David and Heena confirm the text and their public authorship? If they do, could Microsoft's standards team ask the current UTC delegate to route or introduce the paper through the normal member process?

The paper raises a broader standards and discoverability question: whether closely related medical concepts would benefit from clearer guidance on substitutes, visual distinction, and expected usage. It asks the UTC to refer the question to ESR for review and recommendation. It does not request the encoding of a group of emoji. Each candidate would still require its own submission through the official form.

Unicode assigns the official L2 number after accepting a technical document into its public register. The final PDF should therefore be submitted without an L2/26-~~xxx~~ placeholder. The document may support UTC discussion or referral to a working group; it does not replace an individual emoji proposal or guarantee a decision.

Portfolio at a glance

Position today	Concepts	Reason
Planned filings after revision	CT Scan; Blood Bag	All five evidence categories are present; both still need current-method evidence, rights, and design review
First alternate	Pill Box	Complete evidence categories; clearer weekly medication use than Pill Pack, but weak usage and overlap with Pill remain
Promising if evidence is completed	Ultrasound; Weight Scale	Broad uses and promising signals; required Trends or other Google evidence is missing
Other current-cycle drafts	White Blood Cell; Inhaler; IV Bag; Leg Cast; Pill Pack; Maze; First Aid Kit	Each has an evidence gap, a recognition problem, prior declines, or overlap with an existing emoji or another proposal
Later-cycle candidates	Kidney; Stomach; Liver	Their recorded November 4, 2022 decline notices fall within Unicode's four-year bar at the July 31, 2026 deadline

Why Pill Pack is not in the filing plan

Pill Pack is available as a draft, but it is not equivalent to Pill Box in readiness. It is missing Web Trends evidence, its Image Trends comparison uses the wrong comparator, and its 18-pixel image can resemble a keypad or remote. The name also risks confusion with the PillPack pharmacy brand. If the concept is revisited, **Blister Pack** may be the clearer generic name.

Filing both Pill Box and Pill Pack in the same intake would create an avoidable overlap question. The same applies to Blood Bag and IV Bag. The packet includes both pairs so Microsoft can compare them directly.

Relevant history

In 2018, Apple submitted L2/18-080, a proposal for nine accessibility emoji organized around four areas of accessibility. Apple described the set as a finite starting point, worked with disability organizations, and addressed Unicode's concern about open-ended categories. It is a useful example of a vendor explaining how related concepts fit together. Apple used the emoji-proposal process available in 2018; under the 2026 process, each encoding proposal must use the official form.

In 2019, Christian Kamkoff, Shuhan He, and Melissa Thermidor submitted separate proposals for Anatomical Heart and Lungs. Unicode later encoded both characters. The 2026 candidates must still succeed on their own evidence, distinctiveness, rights, and expected usage.

The current 2026 process separates the two routes clearly: individual emoji proposals go through the Emoji Submission Form, while a broader technical discussion document follows Unicode's document-submission process.

Proposal for Emoji: CT Scan

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: CT Scan

Suggested keywords: computed tomography; imaging; scanner; radiology; scan; hospital; exam; diagnostic; machine; contrast

Suggested category: Objects - medical

Suggested sort location: Near X-Ray in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a circular gantry with an open center and a patient table entering the opening. These structural cues identify a medical scanner without a patient, screen, written control, logo, or facility mark.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/ct-scan/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

CT Scan supports conversations about medical imaging, an upcoming scan, waiting for results, radiology, emergency evaluation, follow-up, contrast preparation, and diagnostic testing. Patients, families, clinicians, researchers, and students use CT and computed tomography in both routine and urgent contexts.

The scanner can also represent cross-sectional imaging and radiology more generally when the exact modality is clear from context. It communicates the procedure and machine, which is different from sharing or discussing the resulting image.

B. Use in sequences

- CT Scan + calendar: scheduled scan or appointment.
- CT Scan + hourglass: waiting for imaging or results.
- CT Scan + hospital: radiology department or emergency imaging.
- CT Scan + warning: urgent scan or preparation concern.
- CT Scan + brain, lungs, or another body part: region being scanned.
- CT Scan + document or check mark: report available or results reviewed.

C. Breaks new ground

X-Ray represents a radiographic image, not a CT scanner or tomographic examination. Hospital identifies a place, and Camera does not convey medical imaging. CT Scan would add a recognizable diagnostic machine and an action commonly discussed as an appointment, procedure, and result-producing event.

D. Distinctiveness

The large circular gantry and narrow table form a strong front-facing silhouette. It differs from X-Ray's flat radiograph and from household appliances with circular doors because the table visibly enters the central opening. The same features remain legible in black-and-white and at 18x18.

E. Expected usage level

The required evidence covers general web results, video results, long-term Web and Image Trends interest, and published-book usage. The archived Trends captures use the formal synonym computed tomography and compare it with Unicode's reference term elephant .

Evidence	Result in included capture	Reproducible URL
Google Search	About 488,000,000 results for CT scan ; captured 2020-12-18	https://www.google.com/search?q=CT+scan&hl=en&num=10&pws=0
Google Video Search	About 1,860,000 results for CT scan ; captured 2020-12-18	https://www.google.com/search?tbm=vid&q=CT+scan&hl=en&num=10&pws=0
Google Trends Web Search	Worldwide, 2004-present; sustained computed tomography interest below elephant ; captured 2020-12-18	https://trends.google.com/trends/explore?date=all&q=elephant,computed%20tomography
Google Trends Image Search	Worldwide, 2008-present; sustained image-search interest below elephant ; captured 2020-12-18	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,computed%20tomography
Google Books Ngram Viewer	English, 1500-2022; recent CT scan usage is substantial and below but of the same order as elephant ; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%20CT%20scan&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

The screenshot shows the Google Search interface. The search bar contains the text "CT scan". Below the search bar, the "All" tab is selected, and the results show "About 488,000,000 results (0.57 seconds)".

Google Video Search

The screenshot shows the Google Video Search interface. The search bar contains the text "CT scan". Below the search bar, the "Videos" tab is selected, and the results show "About 1,860,000 results (0.29 seconds)".

Google Trends - Web Search

Google Trends - Image Search

Google Books Ngram Viewer

F. Completeness

Not applicable. CT Scan is independently useful and is not proposed merely to complete a set of imaging modalities or medical devices.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

CT Scan is not adequately represented by X-Ray. X-Ray shows a resulting two-dimensional radiograph; CT Scan represents a different machine, procedure, appointment, and cross-sectional imaging method. General hospital and camera emoji do not resolve that distinction.

B. Overly specific

Computed tomography is a widely used class of diagnostic imaging rather than a particular scan protocol, body region, disease, manufacturer, facility, or device model. The proposal is for the general scanner and examination.

C. Open-ended

This proposal does not request every imaging modality. CT Scan is supported by its own frequency, everyday appointment and results language, distinct visual form, and lack of an adequate substitute.

Other modalities can be judged independently.

D. Transient

Computed tomography has been a durable part of medical imaging for decades. The recognizable gantry-and-table form is stable even as scanner technology changes.

E. Justified only by existing emoji

The proposal does not depend on X-Ray being encoded. X-Ray clarifies a semantic difference; CT Scan's case rests on its own expected usage and expressive gap.

Other Information

The name **CT Scan** is shorter and more familiar in everyday English than **Computed Tomography Scanner**; the formal term should remain a keyword. Vendors should preserve a visibly open gantry and entering table and should avoid depicting a patient, radiation symbol, or diagnostic result inside the glyph.

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Blood Bag

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Blood Bag

Suggested keywords: transfusion; donation; donor; blood bank; plasma; infusion; hospital; supply; type; lifesaving

Suggested category: Objects - medical

Suggested sort location: Near Syringe and Drop of Blood in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a hanging medical bag filled with dark red fluid, with a short outlet tube and a simple droplet-shaped highlight. It contains no label, number, barcode, logo, or blood type, leaving vendors free to adapt detail while preserving the transfusion-bag silhouette.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/blood-bag/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

Blood Bag represents a familiar object used in blood donation, transfusion, hospital care, blood banking, emergency preparedness, and discussions of blood supply. Donors can use it to say they gave blood; recipients and families can use it to discuss a transfusion; hospitals and communities can use it in messages about blood-bank availability without naming an organization or campaign.

The object also covers related blood components when context supplies the distinction, including plasma and platelets. It communicates stored or transfused blood, which is different from a single Drop of Blood and different from a Syringe used to draw or inject fluid.

B. Use in sequences

- Blood Bag + heart: blood donation, gratitude, or support for a recipient.
- Blood Bag + hospital: transfusion, blood bank, or hospital supply.
- Blood Bag + person: donor, recipient, or transfusion appointment.
- Blood Bag + warning: low supply, urgent need, or transfusion concern.
- Blood Bag + calendar: donation date or scheduled treatment.
- Blood Bag + Drop of Blood: blood type, blood component, or collection context.

C. Breaks new ground

No current emoji represents a stored unit of blood or a transfusion. Drop of Blood identifies blood itself but not donation inventory, blood banking, or transfusion; Syringe represents a tool for injection or withdrawal. Blood Bag adds an object with its own roles, verbs, and settings.

D. Distinctiveness

The hanging rectangular bag, visible liquid level, lower port, and short tube form a recognizable silhouette. The red fill and droplet cue strengthen recognition in color, while the bag outline, liquid boundary, port, and droplet-shaped negative space remain readable in black-and-white. The artwork deliberately omits tiny labels that would fail at emoji size.

E. Expected usage level

The required evidence covers general web results, video results, long-term Web and Image Trends interest, and published-book usage. The archived Google Trends captures compare blood bag with Unicode's reference term elephant .

Evidence	Result in included capture	Reproducible URL
Google Search	About 574,000,000 results; captured 2020-12-18	https://www.google.com/search?q=blood+bag&hl=en&num=10&pws=0
Google Video Search	About 10,800,000 results; captured 2020-12-18	https://www.google.com/search?tbm=vid&q=blood+bag&hl=en&num=10&pws=0
Google Trends Web Search	Worldwide, 2004-present; persistent interest below elephant ; captured 2020-12-18	https://trends.google.com/trends/explore?date=all&q=elephant,blood%20bag
Google Trends Image Search	Worldwide, 2008-present; persistent image-search interest below elephant ; captured 2020-12-18	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,blood%20bag
Google Books Ngram Viewer	English, 1500-2022; established but substantially lower published-book usage than elephant ; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%2Cblood%20bag&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

The screenshot shows the Google search interface. The search bar contains the text "blood bag". Below the search bar, the "All" tab is selected, and the results show "About 574,000,000 results (0.44 seconds)". The navigation bar includes links for All, Images, Shopping, News, Videos, More, Settings, and Tools.

Google Video Search

The screenshot shows the Google search interface with the "Videos" tab selected. The search bar contains the text "blood bag". Below the search bar, the results show "About 10,800,000 results (0.32 seconds)". The navigation bar includes links for All, Images, Shopping, News, Videos, More, Settings, and Tools.

Google Trends - Web Search

Google Trends - Image Search

Google Books Ngram Viewer

F. Completeness

Not applicable. Blood Bag is independently useful and is not proposed merely to complete a set of hospital equipment or blood-related symbols.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

Blood Bag is not adequately represented by Drop of Blood or Syringe. A droplet cannot express a stored unit, blood inventory, blood bank, donor collection, or transfusion, and a syringe is a different object with broader injection meanings.

B. Overly specific

The proposal represents the general blood-bag object rather than a blood type, branded donation service, particular blood component, condition, or procedure. It supports donation, transfusion, inventory, and care across many settings.

C. Open-ended

This proposal does not ask for every medical container or piece of hospital equipment. Blood Bag is supported by its own familiar form, multiple uses, frequency evidence, and lack of a clear substitute.

D. Transient

Blood collection, storage, donation, and transfusion are enduring practices. The concept does not depend on a campaign, event, shortage, or temporary technology.

E. Justified only by existing emoji

The proposal does not argue for Blood Bag merely because Drop of Blood and Syringe exist. Those emoji clarify the semantic gap, while the proposal rests on the object's independent uses and evidence.

Other Information

The design should avoid text, blood-type letters, numbers, barcodes, and institutional marks. A visible liquid level and lower port are more useful at emoji scale. Blood Bag and IV Bag are related but semantically different proposals; if only one infusion-container concept advances, user evidence and small-size differentiation should decide between them.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Pill Box

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Pill Box

Suggested keywords: pill organizer; medication; medicine; dose; schedule; adherence; weekly; compartments; reminder; prescription

Suggested category: Objects - medical

Suggested sort location: Near Pill in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a reusable organizer with seven adjacent colored compartments and a simple lid line. It contains no day initials, language, numbers, drug labels, logo, or written dosage.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/pill-box/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

Pill Box represents organizing and remembering medication over time. It supports conversations about preparing doses, checking whether medicine was taken, weekly routines, refilling compartments, helping a family member, packing medicine for travel, and managing more than one daily medication.

The concept is useful to patients, caregivers, families, pharmacists, and anyone using a recurring medicine or supplement. Unlike a particular prescription or condition, the organizer is neutral about what is inside and why it is used.

B. Use in sequences

- Pill Box + calendar: weekly medication plan or refill day.
- Pill Box + check mark: doses organized or medication taken.
- Pill Box + question mark: uncertain or missed dose.
- Pill Box + person or family: caregiver support or medication setup.
- Pill Box + suitcase or airplane: travel medication organizer.
- Pill Box + bell: medication reminder.

C. Breaks new ground

Pill represents medicine generally but does not show a recurring schedule, multiple compartments, or organization. Calendar and Bell can add timing but do not identify medication. Pill Box would add the durable concepts of sorting, preparing, and remembering doses.

D. Distinctiveness

Seven adjacent lidded compartments create a recognizable horizontal organizer in both color and black-and-white. The repeated dividers distinguish it from the single capsule of Pill and from the sealed circular wells of a Pill Pack. The use of seven colors is illustrative only; the form does not depend on day letters or a particular language.

E. Expected usage level

The required evidence covers general web results, video results, long-term Web and Image Trends interest, and published-book usage. The archived Google Trends captures compare `pill box` with Unicode's reference term `elephant`.

Evidence	Result in included capture	Reproducible URL
Google Search	About 214,000,000 results; captured 2020-10-27	https://www.google.com/search?q=pill+box&hl=en&num=10&pws=0
Google Video Search	About 4,830,000 results; captured 2020-10-27	https://www.google.com/search?tbm=vid&q=pill+box&hl=en&num=10&pws=0
Google Trends Web Search	Worldwide, 2004-present; persistent interest below elephant ; captured 2020-10-27	https://trends.google.com/trends/explore?date=all&q=elephant,pill%20box
Google Trends Image Search	Worldwide, 2008-present; persistent image-search interest below elephant ; captured 2020-10-27	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,pill%20box
Google Books Ngram Viewer	English, 1500-2022; established but substantially lower published-book usage than elephant ; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%2Cpill%20box&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

Google Video Search

Google Trends - Web Search

Google Trends - Image Search

Google Books Ngram Viewer

F. Completeness

Not applicable. Pill Box is independently useful and is not proposed merely to complete a set of medication containers.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

Pill cannot clearly express organizing doses, a weekly medication routine, filled compartments, or checking whether a dose was taken. Pill Box supplies a different object and set of actions. Pill Pack overlaps partly and should be compared directly before either is filed.

B. Overly specific

Pill Box is a common medication organizer, not a particular drug, dosage, prescription, condition, brand, or caregiver service. Its compartments are generic and language-neutral.

C. Open-ended

This proposal does not request every medicine container. Pill Box is supported independently by its recurring organizational uses, familiar form, frequency evidence, and lack of a clear substitute.

D. Transient

Reusable pill organizers and medication schedules are durable concepts. The design does not depend on a particular organizer model or temporary technology.

E. Justified only by existing emoji

The proposal does not argue for Pill Box merely because Pill exists. Pill clarifies the semantic gap; Pill Box's case rests on its own uses and evidence.

Other Information

The name `Pill Box` is concise, while `pill organizer` should be a primary keyword to disambiguate it from a decorative box. Vendors should preserve multiple compartments and avoid day initials, which would create language and layout problems. Pill Box and Pill Pack should not both be filed in the same round without first choosing the stronger medication-management concept.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Ultrasound

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Ultrasound

Suggested keywords: sonogram; imaging; scan; probe; diagnostic; pregnancy; cardiac; abdomen; point-of-care; echo

Suggested category: Objects - medical

Suggested sort location: Near X-Ray in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a mobile ultrasound monitor with a fan-shaped scan field and a connected handheld probe. It represents the imaging method and examination without depicting a fetus, patient, body part, diagnosis, manufacturer, facility, written control, or user-interface screen.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.5.0/ultrasound/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.5.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple meanings and usages

Ultrasound is used for diagnostic imaging, real-time bedside examination, pregnancy and fetal imaging, cardiac imaging, abdominal and vascular assessment, musculoskeletal imaging, procedural guidance, and veterinary care. In ordinary conversation it can refer to the appointment, the examination, the machine, the resulting sonogram, or the act of scanning.

The character would support both clinical and personal messages: scheduling or attending a scan, sharing that imaging is underway, waiting for a result, discussing a sonogram, teaching imaging, or identifying ultrasound-guided care. The generic monitor-and-probe paradigm is not limited to pregnancy and does not imply a particular finding.

B. Use in sequences

- Ultrasound + calendar: scheduled scan or appointment.
- Ultrasound + pregnant person: prenatal ultrasound.
- Ultrasound + heart: echocardiography or cardiac ultrasound.
- Ultrasound + hospital: hospital or emergency imaging.
- Ultrasound + eyes: looking beneath the surface or examining something not externally visible.
- Ultrasound + document or check mark: report available or result reviewed.

These are ordinary emoji combinations; no standardized sequence is requested.

C. Breaks new ground

Yes. Ultrasound adds the broadly recognized method of real-time imaging with a handheld probe. X-Ray represents a radiographic image; it does not represent the probe, scanning action, live examination, sonogram appointment, or procedure guidance. Pregnant Person represents a person or state, not an examination, and Hospital represents a place rather than an imaging method.

D. Distinctiveness

The combination of a monitor, fan-shaped scan field, cable, and handheld probe is visually distinctive. The probe separates the image from an ordinary computer or bedside monitor, while the scan sector separates it from a television. The same structural cues remain present at 18x18 and in true black-and-white.

E. Expected usage level

The Google Books comparison supplies a strong durable signal. For 2018-2022, the smoothed English corpus average for `ultrasound` is approximately `7.05e-6`, about 1.70 times the `elephant`

average of 4.14×10^{-6} . The curve rises sharply after the technology entered widespread use and remains above the comparator at the end of the available series.

Evidence completion notice: This draft must not be filed until fresh screenshots are inserted for Google Search, Google Video Search, Google Trends Web Search, and Google Trends Image Search. The current automated Google session was blocked by a CAPTCHA/rate limit; no result count or chart has been invented.

Evidence	Current packet result	Reproducible URL
Google Search	Fresh screenshot and visible result count required	https://www.google.com/search?q=ultrasound&hl=en&num=10&pws=0
Google Video Search	Fresh screenshot and visible result count required	https://www.google.com/search?tbm=vid&q=ultrasound&hl=en&num=10&pws=0
Google Trends Web Search	Fresh Worldwide, 2004-present screenshot against elephant required	https://trends.google.com/trends/explore?date=all&q=elephant,ultrasound
Google Trends Image Search	Fresh Worldwide, 2008-present screenshot against elephant required	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,ultrasound
Google Books Ngram Viewer	Included; ultrasound is approximately 1.70x elephant in the 2018-2022 smoothed English average	https://books.google.com/ngrams/graph?content=elephant%2Cultrasound&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Books Ngram Viewer

F. Completeness

Not applicable. Ultrasound is independently useful and is not proposed merely to complete a set of medical imaging modalities, diagnostic tools, or pregnancy-related emoji.

G. Compatibility

Not applicable. This proposal does not depend on a legacy carrier emoji or an existing proprietary pictograph.

Factors for Exclusion

A. Already represented

Ultrasound is not adequately represented by X-Ray, Hospital, Pregnant Person, or a camera. These characters can communicate anatomy, a location, pregnancy, or a generic image, but none carries

the distinctive handheld scanning action or the familiar meanings `ultrasound`, `sonogram`, and `echo`. A multi-emoji sequence also cannot reliably distinguish the imaging method from other appointments or tests.

B. Overly specific

The proposal covers ultrasound imaging as a broad diagnostic and procedural method. It does not request a specific probe type, organ study, pregnancy stage, body region, specialty, manufacturer, machine, facility, image finding, or diagnosis.

C. Open-ended

The proposal does not argue that every imaging modality should be encoded. Ultrasound has its own high frequency, real-time handheld scanning action, recognizable probe-and-monitor form, and widespread personal, clinical, educational, and veterinary uses. CT, MRI, radiography, and other modalities can be evaluated independently rather than following automatically from this proposal.

D. Transient

Diagnostic ultrasound has been used for decades. Its monitor-and-handheld-probe paradigm is stable even as machines become smaller and image quality improves. The Google Books curve shows sustained growth rather than a short-lived event or campaign.

E. Justified only by existing emoji

The proposal does not claim that X-Ray or Pregnant Person justifies another medical character. Those comparisons identify the expressive gap; Ultrasound's case rests on its own usage, distinct action, broad scope, recognizability, and durability.

Other Information

The public Unicode proposal-status sheet and current released emoji data contain no matching `Ultrasound` or `Sonogram` entry as of 2026-07-10. Because automatically declined requests are omitted from the public sheet, this should be understood as the public-record result rather than proof that no incomplete request was ever sent.

Vendors should preserve the connected handheld probe and a simple fan-shaped scan field. They should avoid showing a fetus or other body part, because that would narrow the character to one use and could imply a medical finding. They should also avoid diagnostic text, waveform labels, a manufacturer-specific console, or a photorealistic sonogram.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Weight Scale

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Weight Scale

Suggested keywords: weighing scale; bathroom scale; body weight; measurement; weigh; fitness; luggage; check-in; tracking; mass

Suggested category: Objects - household

Suggested sort location: Near household measurement objects, distinct from Balance Scale.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a low rectangular platform with rounded corners and a circular dial. A pointer rather than a number communicates measurement without embedding a unit, digit, or locale-specific display.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/weight-scale/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

Weight Scale supports everyday messages about weighing oneself, tracking body weight, a routine checkup, fitness, growth, nutrition, luggage limits, shipping, and whether an object is too heavy. It can stand for the action `weigh`, the measurement `weight`, or the physical appliance.

The concept is not limited to medicine. People use platform scales at home, in gyms, clinics, veterinary settings, travel preparation, and shipping. Context can distinguish body weight from baggage or another measured object without placing a person or number in the emoji itself.

B. Use in sequences

- Weight Scale + person: weighing oneself or a weight check.
- Weight Scale + chart: tracking change over time.
- Weight Scale + suitcase or airplane: luggage weight or check-in limit.
- Weight Scale + package: shipping weight.
- Weight Scale + hospital: clinical measurement or checkup.
- Weight Scale + pet: veterinary weighing.

C. Breaks new ground

Balance Scale represents justice, comparison, and a two-pan instrument, not a platform used to measure body or object weight. Chart and ruler emoji do not identify weight. Weight Scale would add the common act of weighing and a familiar household measurement device.

D. Distinctiveness

The broad floor platform and top dial distinguish the paradigm from Balance Scale's central beam and hanging pans. The shape remains recognizable without a displayed number, so the design avoids units, decimal conventions, and unreadable detail. The circular gauge and pointer survive in the 18x18 and black-and-white examples.

E. Expected usage level

The recovered evidence documents very large general-web and video result counts, and the included Ngram documents long-term published-book usage. No compliant archived Web or Image Trends captures were recovered, so fresh comparisons with Unicode's `elephant` reference term are required before filing.

Evidence	Result in included capture	Reproducible URL
Google Search	About 1,650,000,000 results; captured 2020-12-18	https://www.google.com/search?q=weight+scale&hl=en&num=10&pws=0
Google Video Search	About 387,000,000 results; captured 2020-12-18	https://www.google.com/search?tbm=vid&q=weight+scale&hl=en&num=10&pws=0
Google Trends Web Search	Fresh capture required before filing	https://trends.google.com/trends/explore?date=all&q=elephant,weight%20scale
Google Trends Image Search	Fresh capture required before filing	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,weight%20scale
Google Books Ngram Viewer	English, 1500-2022; established but substantially lower published-book usage than elephant; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%20weight%20scale&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

The screenshot shows the Google Search interface. The search bar contains the text "weight scale". Below the search bar, the "All" tab is selected, and the results show "About 1,650,000,000 results (0.58 seconds)". The navigation bar includes links for All, Shopping, Images, Maps, Videos, More, Settings, and Tools.

Google Video Search

The screenshot shows the Google Video Search interface. The search bar contains the text "weight scale". Below the search bar, the "Videos" tab is selected, and the results show "About 38,700,000 results (0.33 seconds)". The navigation bar includes links for All, Shopping, Images, Maps, Videos, More, Settings, and Tools.

Google Books Ngram Viewer

F. Completeness

Not applicable. Weight Scale is independently useful and is not proposed merely to complete a set of measuring tools.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

Balance Scale is not an adequate substitute. It conventionally represents justice, fairness, and comparison and has a different silhouette. It does not communicate stepping on a scale, checking body weight, or weighing luggage.

B. Overly specific

Weight Scale is a common household and measurement object with health, fitness, travel, shipping, and veterinary uses. It is not a specific device model, measurement unit, target number, diet, or medical condition.

C. Open-ended

This proposal does not request every measurement instrument. Weight Scale is supported independently by broad uses, strong search evidence, visual recognition, and a gap not filled by

Balance Scale.

D. Transient

People have used platform scales for routine weighing for generations. The concept is stable even as mechanical dials and digital displays change.

E. Justified only by existing emoji

The proposal does not depend on Balance Scale's encoding. That emoji clarifies why the two concepts are not interchangeable; Weight Scale's case rests on its own everyday uses and evidence.

Other Information

The paradigm should remain unit-neutral and number-free. A top dial or a small display area is useful for recognition, but vendors should avoid a specific weight, unit, or health judgment. The name `Weight Scale` avoids confusion with musical scales and Balance Scale.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Inhaler

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Inhaler

Suggested keywords: puffer; metered dose; medicine; medication; breathing; asthma; COPD; respiratory; rescue; aerosol

Suggested category: Objects - medical

Suggested sort location: Near Pill and Syringe in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a generic metered-dose inhaler with a metal canister projecting above an L-shaped plastic housing and a small mouthpiece opening. It contains no label, dose counter, number, medicine name, logo, or brand-specific detail.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/inhaler/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

Inhaler supports everyday messages about carrying or finding an inhaler, taking an inhaled medicine, a rescue dose, a routine controller dose, a refill, breathing symptoms, school or sports preparation, travel, and respiratory care. A person can say that an inhaler was forgotten, used, empty, replaced, needed nearby, or packed without naming a disease or drug.

The object is used in home, school, work, exercise, travel, pharmacy, clinic, and emergency contexts. It can refer broadly to inhaled medicine and breathing support while the surrounding text or emoji supplies whether the situation involves asthma, COPD, another respiratory condition, or a general reminder.

B. Use in sequences

- Inhaler + backpack or briefcase: packed for school or work.
- Inhaler + running person or ball: sports preparation or exercise symptoms.
- Inhaler + airplane or suitcase: travel medication.
- Inhaler + bell or calendar: dose reminder or refill date.
- Inhaler + warning: rescue inhaler needed, empty device, or breathing concern.
- Inhaler + lungs, face exhaling, or hospital: respiratory treatment or care context.

C. Breaks new ground

No current emoji represents an inhaler or inhaled medicine. Lungs represent anatomy, Face Exhaling represents an action or feeling, Syringe represents injection, and Pill represents swallowed medicine. Inhaler would add a familiar handheld object and a distinct route of medication use without encoding a particular drug or condition.

D. Distinctiveness

The projecting canister, tall actuator body, bent lower housing, and short mouthpiece form a recognizable L-shaped silhouette. It differs from Syringe's long needle and barrel and from Pill's capsule form. Those structural cues remain visible in the black-and-white and 18x18 examples; color is not required for identification.

E. Expected usage level

The recovered 2018 proposal provides a traceable Google Search snapshot and archived Web and Image Trends comparisons with `syringe`. The prior Trends scope was United States and twelve months, not the current Worldwide and `elephant` methodology. A fresh Google Video capture and

fresh Web and Image Trends captures against **elephant** are therefore required before filing. A new Google Books Ngram comparison is included.

Evidence	Result in included capture	Reproducible URL
Google Search	About 32,700,000 results; captured by 2018-06-07	https://www.google.com/search?q=inhaler&hl=en&num=10&pws=0
Google Video Search	Fresh capture required before filing	https://www.google.com/search?tbm=vid&q=inhaler&hl=en&num=10&pws=0
Google Trends Web Search	Archived United States, 12-month comparison with syringe ; fresh Worldwide elephant comparison required	https://trends.google.com/trends/explore?date=all&q=elephant,inhaler
Google Trends Image Search	Archived United States, 12-month comparison with syringe ; fresh Worldwide elephant comparison required	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,inhaler
Google Books Ngram Viewer	English, 1500-2022; sustained and increasing recent published-book usage below elephant ; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%2Cinhaler&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

Archived Google Trends - Web and Image Search (reference only; comparator and scope must be replaced)

Google Books Ngram Viewer

F. Completeness

Not applicable. Inhaler is independently useful and is not proposed merely to complete a set of medication routes, respiratory devices, or medical objects.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

Inhaler is not adequately represented by Lungs, Face Exhaling, Syringe, Pill, or Hospital. Those emoji can provide anatomy, symptom, medicine, or care context but cannot identify the device, carrying it, using it, forgetting it, or refilling it.

B. Overly specific

The proposal represents the general metered-dose inhaler rather than a particular medicine, dose, brand, device model, disease, or treatment plan. The same recognizable object supports routine, rescue, reminder, travel, pharmacy, and breathing-related uses.

C. Open-ended

This proposal does not request every respiratory device or medicine-delivery system. The metered-dose inhaler is evaluated on its own recognition, everyday actions, frequency evidence, visual form, and lack of an adequate substitute. Nebulizers, dry-powder devices, and other equipment can be judged independently.

D. Transient

Metered-dose inhalers have retained the same basic canister, actuator, and mouthpiece form for decades. The proposed generic silhouette does not depend on a temporary product, interface, campaign, or treatment trend.

E. Justified only by existing emoji

The proposal does not argue that Inhaler should be encoded merely because Pill or Syringe exists. Those emoji clarify distinct routes and uses; Inhaler's case rests on the actions and messages enabled by the device itself.

Other Information

The earlier public proposal, L2/18-215, was reviewed in 2018 and did not advance. The recorded concern was uncertainty about worldwide recognition and usage. This draft replaces the earlier **Multiple usages: None known** answer with concrete everyday uses, supplies new textless artwork, and identifies the exact global evidence still required before resubmission. The design should remain a generic metered-dose inhaler and should not show a person, face, medicine label, dose counter, or branded color pattern.

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: White Blood Cell

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: White Blood Cell

Suggested keywords: leukocyte; immunity; immune system; infection; inflammation; blood; cell; laboratory; microscope; neutrophil

Suggested category: People & Body - body-parts

Suggested sort location: Near Drop of Blood in the body-parts subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a pale round cell with an irregular membrane and a dark, multi-lobed nucleus. Those cues distinguish a leukocyte from the existing Microbe emoji and from a simple colored circle.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/white-blood-cell/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

White blood cells are familiar components of blood and the immune system. The emoji would support ordinary conversations about immunity, infection, inflammation, immune response, white-cell counts, blood tests, laboratory results, chemotherapy monitoring, and school biology. It can also express the everyday idea of the body "fighting" an infection without specifying a disease.

The concept is useful beyond a single clinical setting. Students and educators discuss leukocytes in biology; patients and families encounter white-cell counts in routine laboratory panels; and researchers use the term across immunology, hematology, infectious disease, and microscopy. A general white blood cell provides the broad concept without encoding a particular leukocyte subtype.

B. Use in sequences

- White Blood Cell + shield: immune defense or protection.
- White Blood Cell + Microbe: immune response to infection.
- White Blood Cell + test tube: blood count, laboratory test, or research.
- White Blood Cell + down arrow or up arrow: low or high white-cell count.
- White Blood Cell + microscope or book: cell biology, immunology, or education.
- White Blood Cell + hospital or pill: treatment monitoring or clinical care.

C. Breaks new ground

No current emoji represents an immune cell. Microbe represents a microscopic organism, not a human defense cell; Drop of Blood represents blood as a fluid; and Test Tube represents a container or laboratory activity. White Blood Cell would add the cellular component of immunity and make interactions between host cells and microbes visually expressible.

D. Distinctiveness

The multi-lobed nucleus is the essential distinguishing feature. In both color and black-and-white, it creates a compact silhouette unlike Microbe's radiating projections or Drop of Blood's teardrop form. The proposal does not require microscopic realism: an irregular outer edge and one dark, lobed nucleus are enough at emoji scale.

E. Expected usage level

The included evidence documents substantial general-web, video, and published-book use. An archived Web Trends chart is retained as supporting history, but it uses `petri dish` rather than Unicode's `elephant` reference term. A fresh Web Trends capture and a fresh Image Trends capture with `elephant` must replace or supplement it before filing.

Evidence	Result in included capture	Reproducible URL
Google Search	About 1,100,000,000 results; captured 2020-12-18	https://www.google.com/search?q=white+blood+cell&hl=en&num=10&pws=0
Google Video Search	About 8,630,000 results; captured 2020-12-18	https://www.google.com/search?tbm=vid&q=white+blood+cell&hl=en&num=10&pws=0
Google Trends Web Search	Archived comparison with petri dish; fresh elephant comparison required before filing	https://trends.google.com/trends/explore?date=all&q=elephant,white%20blood%20cell
Google Trends Image Search	Fresh capture required before filing	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,white%20blood%20cell
Google Books Ngram Viewer	English, 1500-2022; sustained and increasing published-book usage, below elephant; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%20white%20blood%20cell&year_start=1500&year_end=2022&corpus=en&smoothing=3

Archived Google Trends - Web Search (reference only; comparator must be replaced)

Google Books Ngram Viewer

F. Completeness

Not applicable. White Blood Cell is independently useful and is not proposed merely to complete a set of blood components or cells.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

White Blood Cell is not represented by Microbe, Drop of Blood, Test Tube, Microscope, or Shield. Those emoji can provide context, but none identifies an immune cell or a white-cell count.

B. Overly specific

The proposal is for the general white blood cell concept, not a particular subtype, disease, laboratory value, or treatment. Its uses span routine testing, immunity, infection, education, and research.

C. Open-ended

This proposal does not request an open-ended catalog of cells. White Blood Cell is supported independently by expected usage, common recognition, multiple contexts, and an expressive gap.

D. Transient

White blood cells are a durable biological concept used in medicine, education, and research. Their relevance is not tied to a temporary outbreak, campaign, or technology.

E. Justified only by existing emoji

The proposal does not depend on the existence of Microbe or Drop of Blood. Those emoji help demonstrate the semantic gap; the case for White Blood Cell rests on its own usages and frequency evidence.

Other Information

The formal synonym `leukocyte` should be included as a keyword, while `White Blood Cell` is the clearer display name. The paradigm should avoid spikes or a face, which could make it read as Microbe. The lobed nucleus should remain visible in monochrome and at 18x18.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: IV Bag

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: IV Bag

Suggested keywords: intravenous; infusion; drip; fluids; hydration; medicine; hospital; therapy; saline; treatment

Suggested category: Objects - medical

Suggested sort location: Near Syringe in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a hanging clear medical bag with light blue fluid, a visible liquid level, and a short lower tube. It contains no label, number, dosage, logo, or barcode.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/iv-bag/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

IV Bag supports conversations about intravenous fluids, hydration, infusions, hospital or clinic treatment, medication delivery, an infusion appointment, recovery, and veterinary care. It can express the general experience of "being on an IV" without specifying a drug, diagnosis, or facility.

The concept appears across emergency care, surgery, outpatient infusion, home infusion, and routine fluid replacement. It is also understood as a drip or infusion bag. A general bag allows context to supply whether the contents are saline, medication, nutrition, or another non-blood fluid.

B. Use in sequences

- IV Bag + droplet: intravenous fluids or hydration.
- IV Bag + hospital: inpatient care or treatment.
- IV Bag + calendar: infusion appointment or treatment schedule.
- IV Bag + pill or syringe: medication infusion.
- IV Bag + person: receiving an IV or supporting a patient.
- IV Bag + pet: veterinary infusion or fluid care.

C. Breaks new ground

Syringe represents injection or withdrawal with a handheld instrument, not a bag delivering fluid over time. Droplet represents liquid but not intravenous treatment. IV Bag would add infusion as a distinct object and mode of care.

D. Distinctiveness

The hanging bag, horizontal fluid level, lower port, and tube create a compact medical silhouette. A light or clear fluid differentiates it from Blood Bag in color. In monochrome, Blood Bag's droplet emblem provides the primary distinction, while IV Bag remains unmarked. Vendors may use subtle chamber or tubing cues but should avoid text and tiny measurement scales.

E. Expected usage level

The recovered evidence documents substantial general-web and video result counts, and the included Ngram documents published-book use. No compliant archived Web or Image Trends captures were recovered, so fresh comparisons with Unicode's `elephant` reference term are required before filing.

Evidence	Result in included capture	Reproducible URL
Google Search	About 366,000,000 results; captured 2020-12-18	https://www.google.com/search?q=IV+bag&hl=en&num=10&pws=0
Google Video Search	About 6,380,000 results; captured 2020-12-18	https://www.google.com/search?tbm=vid&q=IV+bag&hl=en&num=10&pws=0
Google Trends Web Search	Fresh capture required before filing	https://trends.google.com/trends/explore?date=all&q=elephant,IV%20bag
Google Trends Image Search	Fresh capture required before filing	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,IV%20bag
Google Books Ngram Viewer	English, 1500-2022; established but substantially lower published-book usage than elephant ; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%2CIV%20bag&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

The screenshot shows the Google search interface. The search bar contains the text "IV bag". Below the search bar, the "All" tab is selected, and the results show "About 366,000,000 results (0.56 seconds)". The navigation bar includes links for All, Images, Shopping, Videos, News, More, Settings, and Tools.

Google Video Search

The screenshot shows the Google search interface with the "Videos" tab selected. The search bar contains the text "IV bag". Below the search bar, the results show "About 6,380,000 results (0.36 seconds)". The navigation bar includes links for All, Images, Shopping, Videos, News, More, Settings, and Tools.

Google Books Ngram Viewer

F. Completeness

Not applicable. IV Bag is independently useful and is not proposed merely to complete a set of hospital equipment or infusion containers.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

IV Bag is not adequately represented by Syringe, Droplet, Hospital, or Pill. Those emoji can supply context but do not identify a hanging infusion, intravenous fluids, or treatment delivered over time.

B. Overly specific

The concept is a general infusion bag, not a particular medicine, fluid composition, procedure, device manufacturer, or care setting. Its uses span hydration, medication, treatment, and veterinary care.

C. Open-ended

This proposal does not request every medical container or piece of hospital equipment. IV Bag is supported independently by its familiar form, multiple uses, search evidence, and expressive gap.

D. Transient

Intravenous infusion is a longstanding and durable form of care. The concept is not tied to a temporary treatment, product, event, or campaign.

E. Justified only by existing emoji

The proposal does not argue for IV Bag merely because Syringe exists. Syringe clarifies a different treatment mode; IV Bag's case rests on its own uses and evidence.

Other Information

The artwork should remain generic and text-free. A clear or light blue fluid is a useful default but should not imply a specific solution. IV Bag and Blood Bag are related shapes; they should not both be filed without a deliberate portfolio decision and a small-size distinction test.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Leg Cast

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Leg Cast

Suggested keywords: cast; broken leg; fracture; injury; recovery; orthopedic; plaster; splint; healing; mobility

Suggested category: People & Body - body-parts

Suggested sort location: Near Leg in the body-parts subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a bent lower leg with a white cast wrapping the shin, ankle, and foot. A few diagonal wrap lines clarify the rigid covering without adding text, signatures, or decoration.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/leg-cast/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

Leg Cast supports conversations about a broken leg, fracture, orthopedic treatment, injury, recovery, follow-up appointments, mobility restrictions, returning to school or work, and the period until a cast is removed. It can express both the physical object and the temporary condition of having one's leg immobilized.

The concept is used in everyday messages among patients, families, classmates, teammates, and coworkers. It is not limited to a particular sport, accident, bone, procedure, or diagnosis. The familiar cast silhouette communicates recovery and restricted movement even when the cause is not specified.

B. Use in sequences

- Leg Cast + warning: broken leg or acute injury.
- Leg Cast + calendar: healing time, follow-up, or cast-removal date.
- Leg Cast + school or briefcase: returning with a cast or needing accommodation.
- Leg Cast + wheelchair or crutch context: restricted mobility.
- Leg Cast + hospital: orthopedic treatment or follow-up.
- Leg Cast + sparkles or check mark: healing or cast removed.

C. Breaks new ground

Leg shows an uninjured limb, and Adhesive Bandage represents a small wound covering rather than rigid immobilization. A sequence of Leg plus Adhesive Bandage remains ambiguous and cannot reproduce the full lower-leg cast silhouette. Leg Cast would add a common temporary injury and recovery state.

D. Distinctiveness

The cast's bright, thick covering around the shin and foot creates a silhouette distinct from the existing bare Leg. Sparse wrap lines remain visible in black-and-white and at 18x18. The design avoids crutches, a wheelchair, or an injury symbol inside the glyph, allowing those ideas to be added in sequences.

E. Expected usage level

The included evidence documents general-web, video, Web Trends, Image Trends, and published-book use. The archived Trends captures compare leg cast with motorized wheelchair, not Unicode's elephant reference term. Fresh Web and Image Trends captures with elephant are required before filing.

Evidence	Result in included capture	Reproducible URL

Google Books Ngram Viewer

F. Completeness

The exposed skin should support the standard emoji skin-tone modifiers if the character is encoded as a body part. The cast itself should remain neutral in color. This is a defined modifier behavior, not a request for separate cast variants.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

Leg plus Adhesive Bandage does not clearly communicate a rigid cast, fracture recovery, or immobilization. The proposed glyph encodes a single recognizable condition rather than relying on an ambiguous sequence.

B. Overly specific

Leg Cast represents a common class of orthopedic injury and recovery, not a particular bone, fracture pattern, cast material, accident, sport, or medical service.

C. Open-ended

This proposal does not request every injury or orthopedic device. Leg Cast is evaluated on its own recognition, everyday use, frequency evidence, and expressive gap.

D. Transient

Casts and fracture recovery are enduring concepts. An individual's cast is temporary, but the represented idea is no more transient than other encoded states, activities, or medical objects.

E. Justified only by existing emoji

The proposal does not depend on Leg or Adhesive Bandage being encoded. Those characters demonstrate why an existing sequence is unclear; Leg Cast has independent uses and evidence.

Other Information

The paradigm should show enough uncovered leg for the anatomy to read while keeping the cast visually dominant. Vendors should avoid written names, signatures, or decorative messages on the

cast. The skin-tone requirement and likely similarity to Leg make this a higher-complexity candidate than a standalone medical object.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Pill Pack

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Pill Pack

Suggested keywords: blister pack; medication; medicine; dose; pharmacy; tablets; prescription; schedule; packaging; treatment

Suggested category: Objects - medical

Suggested sort location: Near Pill in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a silver rectangular blister strip with eight round tablets. It contains no label, number, logo, or written dosage, and the repeated cavities remain legible in monochrome.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.3.0/pill-pack/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.3.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple usages

Pill Pack represents medication as a packaged course or set of doses. It supports conversations about starting or finishing a course, remembering whether a dose was taken, refilling medicine, pharmacy dispensing, packing medication for travel, and counting remaining tablets. These uses differ from referring to medicine in the abstract.

Blister packaging is used for prescription and nonprescription products in many countries. The repeated sealed doses visually communicate quantity, sequence, and remaining supply without requiring a specific drug, language, brand, or dosage.

B. Use in sequences

- Pill Pack + calendar: medication schedule or course of treatment.
- Pill Pack + check mark: dose taken or course completed.
- Pill Pack + question mark: missed dose or uncertainty about medication.
- Pill Pack + airplane or suitcase: travel medication.
- Pill Pack + hospital or pharmacy context: dispensing or refill.
- Pill Pack + warning: packaging problem, interaction concern, or medication caution.

C. Breaks new ground

Pill represents one capsule or tablet and does not show a packaged sequence of doses. Pill Box represents reusable organization by time or day. Pill Pack would add sealed medication packaging, supporting messages about remaining supply, adherence, dispensing, and a finite course of treatment.

D. Distinctiveness

The rounded rectangular foil strip and repeated circular cavities form a clear grid at small sizes. The silhouette differs from the single two-color capsule of Pill and from the compartmented, hinged form of a Pill Box. Color is optional; the black-and-white version retains the border and eight raised tablets.

E. Expected usage level

The included evidence documents general-web, video, image-search, and published-book use. The archived Image Trends chart compares `pill pack` with `fax machine`, not Unicode's `elephant` reference term, and no archived Web Trends chart was recovered. Fresh Web and Image Trends captures with `elephant` are required before filing.

Evidence	Result in included capture	Reproducible URL
Google Search	About 497,000,000 results; captured 2020-12-18	https://www.google.com/search?q=pill+pack&hl=en&num=10&pws=0
Google Video Search	About 4,360,000 results; captured 2020-12-18	https://www.google.com/search?tbm=vid&q=pill+pack&hl=en&num=10&pws=0
Google Trends Web Search	Fresh capture required before filing	https://trends.google.com/trends/explore?date=all&q=elephant,pill%20pack
Google Trends Image Search	Archived comparison with fax machine; fresh elephant comparison required before filing	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,pill%20pack
Google Books Ngram Viewer	English, 1500-2022; established but substantially lower published-book usage than elephant; captured 2026-07-10	https://books.google.com/ngrams/graph?content=elephant%2Cpill%20pack&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Search

The screenshot shows the Google Search interface. The search bar contains the text "pill pack". Below the search bar, the "All" tab is selected, and the results show "About 497,000,000 results (0.48 seconds)". The navigation bar includes links for All, News, Images, Videos, Shopping, More, and Settings.

Google Video Search

The screenshot shows the Google Video Search interface. The search bar contains the text "pill pack". Below the search bar, the "Videos" tab is selected, and the results show "About 4,360,000 results (0.32 seconds)". The navigation bar includes links for All, News, Images, Videos, Shopping, More, Settings, and Tools.

Archived Google Trends - Image Search (reference only; comparator must be replaced)

Google Books Ngram Viewer

F. Completeness

Not applicable. Pill Pack is independently useful and is not proposed merely to complete a set of medication containers.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already represented

Pill can represent medicine generally, but it cannot clearly express a blister strip, remaining packaged doses, or a course with multiple sealed units. Pill Pack and Pill Box should nevertheless be compared directly before filing because both compete for some medication-management uses.

B. Overly specific

The concept is a common medication package, not a particular drug, dose, manufacturer, prescription, or market. The design intentionally omits written information and branding.

C. Open-ended

This proposal does not request every form of pharmaceutical packaging. The blister strip is evaluated on its own recognition, uses, frequency evidence, and distinction from existing emoji.

D. Transient

Blister packs are a longstanding form of medication packaging used across languages and health systems. The concept is not tied to a temporary product or campaign.

E. Justified only by existing emoji

The proposal is not based on the existence of Pill. Pill helps define the expressive gap; Pill Pack's case rests on packaged-course and dose-management uses that a single capsule does not carry.

Other Information

The artwork should use a compact strip with repeated sealed units and no text. A mix of capsule shapes or colors is unnecessary and could imply multiple drugs. This proposal should not be filed in the same round as Pill Box without first choosing which medication-container concept has the stronger independent demand.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Maze

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: Maze

Suggested keywords: labyrinth; puzzle; mouse; path; navigation; learning; memory; choice; complexity; research

Suggested category: Activities - game

Suggested sort location: Near Puzzle Piece in the game subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a mouse navigating a square labyrinth with broad corridors, a visible entrance, and a visible exit. The mouse-maze scene identifies both the physical puzzle and the act of finding a route. It is not a specific laboratory apparatus, map, floor plan, user-interface icon, logo, or exact puzzle.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.5.0/maze/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.5.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple meanings and usages

Maze names both a physical puzzle and a common metaphor for complexity, confusion, difficult navigation, and searching for a way through a problem. It can represent paper and book puzzles, garden and hedge mazes, corn mazes, escape games, level design, route planning, problem-solving exercises, and the experience of being lost in an unfamiliar place or process.

The mouse-maze image also directly supports learning, memory, decision-making, behavioral research, and education. Those uses do not limit the character to a laboratory: a mouse navigating corridors is an iconic visual shorthand for any maze, choice among paths, trial and error, and searching for an exit.

B. Use in sequences

- Maze + thinking face: working through a difficult problem.
- Maze + map or compass: finding a route or navigating a confusing place.
- Maze + person running: maze race, escape game, or obstacle challenge.
- Maze + microscope: behavioral experiment or laboratory research.
- Maze + brain: learning, memory, cognition, or decision-making.
- Maze + school: classroom puzzle or learning exercise.
- Maze + check mark: puzzle solved or way out found.

These are ordinary emoji combinations; no standardized sequence is requested.

C. Breaks new ground

Yes. Puzzle Piece represents one interlocking piece, not a navigable network with multiple routes and dead ends. Map represents geography, and Compass represents orientation. The mouse-maze scene adds the action of navigating a bounded path puzzle, choosing among alternatives, encountering dead ends, learning from prior routes, and finding a way through complexity.

D. Distinctiveness

The enclosing square, thick right-angle walls, entrance and exit gaps, mouse body, round ears, pointed nose, and tail produce a recognizable scene. The corridors and mouse remain simplified for 18x18. The image differs from a QR code because it uses a few broad continuous walls, and it differs from Map because it has no folds, roads, labels, or location marks.

E. Expected usage level

The Google Books comparison provides a durable historical signal. For 2018-2022, the smoothed English corpus average for `maze` is approximately $2.77\text{e-}6$, about 67 percent of `elephant` ($4.14\text{e-}6$). The curve shows sustained use over centuries and a pronounced rise in the late twentieth and early twenty-first centuries.

Evidence completion notice: This draft must not be filed until fresh screenshots are inserted for Google Search, Google Video Search, Google Trends Web Search, and Google Trends Image Search. The current automated Google session was blocked by a CAPTCHA/rate limit; no result count or chart has been invented.

Evidence	Current packet result	Reproducible URL
Google Search	Fresh screenshot and visible result count required	https://www.google.com/search?q=maze&hl=en&num=10&pws=0
Google Video Search	Fresh screenshot and visible result count required	https://www.google.com/search?tbm=vid&q=maze&hl=en&num=10&pws=0
Google Trends Web Search	Fresh Worldwide, 2004-present screenshot against <code>elephant</code> required	https://trends.google.com/trends/explore?date=all&q=elephant,maze
Google Trends Image Search	Fresh Worldwide, 2008-present screenshot against <code>elephant</code> required	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,maze
Google Books Ngram Viewer	Included; <code>maze</code> is approximately 0.67x <code>elephant</code> in the 2018-2022 smoothed English average	https://books.google.com/ngrams/graph?content=elephant%2Cmaze&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Books Ngram Viewer

F. Completeness

Not applicable. Maze is independently useful and is not proposed to complete a fixed collection of games, puzzles, navigation tools, educational activities, or research apparatuses.

G. Compatibility

Not applicable. The proposal does not depend on a legacy carrier emoji or a high-frequency pictograph in a particular existing service.

Factors for Exclusion

A. Already represented

No existing emoji expresses a mouse navigating a bounded network of branching paths and dead ends. Mouse plus Puzzle Piece does not show route choice, and Mouse plus Map reads as an

animal and geographic map. Those sequences ask the reader to infer a scene that the mouse-maze paradigm communicates directly.

B. Overly specific

The proposal covers mazes and labyrinths as a broad class. The mouse is an iconic navigator and does not restrict the meaning to a named apparatus, species, experiment, protocol, game level, corridor count, solution, building, garden, or cultural site.

C. Open-ended

Maze is not one arbitrary puzzle design among many. The mouse navigating branching paths supports learning, memory, navigation, complexity, confusion, choice, and escape meanings that a crossword, jigsaw, riddle, or board game does not. The proposal does not imply that each puzzle type or research apparatus should be encoded.

D. Transient

Mazes and labyrinths have a long cultural history, and the Ngram curve demonstrates sustained published use. Their physical and metaphorical meanings do not depend on a current app, game, campaign, or technology.

E. Justified only by existing emoji

The case does not rest on Puzzle Piece, Map, or Compass already being encoded. Those comparisons define the remaining semantic gap; Maze stands on its own multiple meanings, distinctive form, frequency evidence, and durability.

Other Information

The public status record lists declined Maze rows with `Date Submitted` values of 2018-04-12 and 2020-12-18. The present proposal is outside the four-year resubmission period by the 2026-07-31 deadline. It uses new original mouse-maze artwork. Research, learning, and memory are concrete uses; the proposal does not rely on neuroscience representation, disease awareness, or another cause as a selection factor.

Vendors should preserve a simple mouse with a visible body, ears, nose, and tail inside broad corridors. They should keep the entrance and exit open and avoid a brain, cage, researcher, directional arrow, written label, or identifiable commercial or real-world maze.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: First Aid Kit

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-10

Identification

Suggested name: First Aid Kit

Suggested keywords: emergency; supplies; care; injury; safety; preparedness; bandage; medicine; kit; rescue

Suggested category: Objects - medical

Suggested sort location: Near Adhesive Bandage in the medical objects subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm is a portable green handled case with a generic white safety cross. It represents a container of basic care supplies without showing a protected red cross or red crescent emblem, written label, company mark, specific product, medicine brand, or exact required contents.

The example images are original vector artwork created for this proposal and released under CC0 1.0. Editable SVG sources and the license are included in the public packet:

<https://github.com/ShuhanCS/medicalemoji/tree/codex/eligible-2026-slate/submissions/v1.5.0/first-aid-kit/images>

<https://github.com/ShuhanCS/medicalemoji/blob/codex/eligible-2026-slate/submissions/v1.5.0/ARTWORK-LICENSE.md>

Factors for Inclusion

A. Multiple meanings and usages

First Aid Kit represents immediate basic care, a prepared set of supplies, emergency readiness, workplace safety, travel preparation, sports and outdoor safety, school and household supplies, disaster kits, field care, and help available nearby. In conversation it can mean `bring the kit`, `where are the supplies`, `we are prepared`, `minor injury`, `basic care needed`, or `help is on the way`.

The kit also works figuratively as a compact set of remedies or tools for handling a problem. It is the broad container-and-supplies concept, not one medication, wound, protocol, or institution.

B. Use in sequences

- First Aid Kit + warning: emergency supplies or safety alert.
- First Aid Kit + house, school, or office: kit location.
- First Aid Kit + car or airplane: travel safety supplies.
- First Aid Kit + hiking boot or tent: outdoor preparedness.
- First Aid Kit + sports ball: team or event first aid.
- First Aid Kit + check mark: stocked, inspected, or ready.

These are ordinary emoji combinations; no standardized sequence is requested.

C. Breaks new ground

Yes. Adhesive Bandage represents one treatment item, Pill and Syringe represent individual medical products, and Toolbox represents general repair tools. First Aid Kit adds the distinct concept of a portable, prepared collection of basic care supplies and supports safety, readiness, location, and response meanings that no single existing emoji carries.

D. Distinctiveness

The handled rectangular case and centered cross create a compact, recognizable silhouette. The broad handle, case outline, and cross remain legible at 18x18 and in true black-and-white. The green-and-white color scheme separates the concept from an ordinary luggage case while avoiding the protected red cross emblem.

E. Expected usage level

For 2018-2022, the smoothed English Google Books average for `first aid kit` is approximately $3.13\text{e-}7$, about 7.5 percent of `elephant` ($4.14\text{e-}6$). The curve rises over the twentieth century and

ends at its highest level. Because it is below the comparator, the missing Search, Video, and Trends evidence is especially important to the filing decision.

Evidence completion notice: This draft must not be filed until fresh screenshots are inserted for Google Search, Google Video Search, Google Trends Web Search, and Google Trends Image Search. The current automated Google session was blocked by a CAPTCHA/rate limit; no result count or chart has been invented.

Evidence	Current packet result	Reproducible URL
Google Search	Fresh screenshot and visible result count required; use the grouped multiword query	https://www.google.com/search?q=first-aid-kit&hl=en&num=10&pws=0
Google Video Search	Fresh screenshot and visible result count required; use the grouped multiword query	https://www.google.com/search?tbm=vid&q=first-aid-kit&hl=en&num=10&pws=0
Google Trends Web Search	Fresh Worldwide, 2004-present screenshot against elephant required	https://trends.google.com/trends/explore?date=all&q=elephant,first%20aid%20kit
Google Trends Image Search	Fresh Worldwide, 2008-present screenshot against elephant required	https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,first%20aid%20kit
Google Books Ngram Viewer	Included; first aid kit is approximately 0.075x elephant in the 2018-2022 smoothed English average	https://books.google.com/ngrams/graph?content=elephant%20first%20aid%20kit&year_start=1500&year_end=2022&corpus=en&smoothing=3

Google Books Ngram Viewer

F. Completeness

Not applicable. First Aid Kit is independently useful and is not proposed to complete an inventory of medical supplies, emergency equipment, containers, workplace-safety items, or treatments.

G. Compatibility

Not applicable. This proposal does not depend on a legacy carrier emoji or a high-frequency pictograph in a particular existing service.

Factors for Exclusion

A. Already represented

No existing emoji reliably means a prepared first aid kit. Adhesive Bandage communicates one item or an injury, while Toolbox ordinarily means mechanical repair. Medical Symbol identifies medicine or

health in general and does not show a portable supply container. Combining these characters still does not provide the recognizable handled-kit paradigm or the concise meanings `supplies` `ready` and `first aid` here.

B. Overly specific

The proposal covers first aid kits across homes, workplaces, schools, vehicles, travel, sports, outdoor activities, and emergency preparation. It does not prescribe the case, contents, standard, protocol, organization, manufacturer, or injury.

C. Open-ended

First Aid Kit is an iconic bundle: one container stands for a broad set of basic care supplies. Its inclusion would reduce, rather than create, pressure to encode each bandage, wipe, gauze pad, glove, tape roll, cold pack, or other component. Other specialized medical bags or emergency devices can be assessed independently.

D. Transient

Portable first aid kits are a durable safety object used across changing products and standards. The handled case paradigm and readiness meaning do not depend on a current campaign, disaster, brand, app, or short-lived practice.

E. Justified only by existing emoji

The proposal does not argue that Adhesive Bandage or Medical Symbol justifies another medical character. Those comparisons identify the semantic gap; First Aid Kit stands on its own broad uses, distinct container form, preparedness meaning, and durable role.

Other Information

The public status sheet has no matching `First Aid Kit` entry as of 2026-07-10. `First Aid Ointment` expired on 2017-11-30, but ointment is a substance; a kit is a supply container. The International Committee of the Red Cross explains that its red cross, red crescent, and red crystal emblems are legally protected. This example therefore uses a generic white cross on green:

<https://www.icrc.org/en/law-and-policy/use-emblems>

Vendors can vary the green, handle, latches, and proportions while retaining a handled case and generic non-red safety cross. They should avoid text, a commercial design, or tiny visible contents.

Official Unicode proposal guidance:

<https://www.unicode.org/emoji/proposals.html>

Proposal for Emoji: Kidney

Submitter: Shuhan He; Edgar Lerma; Caitlyn Vlasschaert; Jade M. Teakell; Harish Seethapathy; Jarone Lee; Danielle Miller; Timur Erk

Main point of contact: Shuhan He

Date: 2026-07-12

Identification

Suggested name: Kidney

Suggested keywords: renal; anatomy; organ; filtration; urine; hydration; dialysis; transplant; donation; stone; bean-shaped

Suggested category: People & Body - body-parts

Suggested sort location: Near anatomical heart, lungs, and brain in the body-parts subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm shows one large kidney with a pronounced hilum, a short renal-vessel cue, and a tan ureter. The single bold specimen remains legible at small sizes, while the hilum and plumbing cues distinguish the organ from a food bean. Vendors may simplify shading but should preserve the medial notch and at least one short attached structure.

I, Shuhan He, certify that these example images are original work created for this proposal, that I own all IP Rights in them, and that they contain no third-party artwork, logo, trademark, or text. I release the images under the CC0 1.0 Universal Public Domain Dedication and grant the rights required by the Unicode Emoji Proposal Agreement and License.

CC0 1.0: <https://creativecommons.org/publicdomain/zero/1.0/>

Factors for Inclusion

A. Multiple meanings

Kidney has established meanings beyond a literal anatomical reference. Kidney names kidney beans and appears in the conventional descriptor kidney-shaped for pools, tables, dishes, and other objects. These extended meanings are familiar without depending on a pun or a temporary campaign.

Merriam-Webster records kidney-shaped as an adjective meaning shaped like a kidney: <https://www.merriam-webster.com/dictionary/kidney-shaped>

B. Use in sequences

Kidney can combine with existing emoji to create messages without standardized sequences:

- Kidney + droplet: hydration, urine production, or filtration.
- Kidney + warning: kidney stone, abnormal result, or urgent kidney concern.
- Kidney + hospital or pill: kidney care, dialysis, treatment, or medication review.
- Kidney + people or heart: donation, transplant, recipient, caregiver, or support.
- Kidney + book or microscope: anatomy, school science, or laboratory testing.
- Kidney + bean or cooking pot: kidney beans or food context.

C. Breaks new ground

Yes. No current emoji represents the kidneys or urinary-system anatomy. A bean primarily represents food; a droplet is ambiguous among water, sweat, tears, blood, and urine; and hospital, pill, and syringe represent places or interventions rather than the organ. Kidney would therefore add a distinct internal-organ concept and enable messages that cannot be expressed clearly with existing emoji.

D. Distinctiveness

The large maroon organ body, medial hilum, and attached vessel or ureter make the proposed paradigm visually distinct from the existing beans emoji. Beans are presented as food and have no anatomical plumbing; the proposed image is one wet-organ specimen with a pronounced notch and a short tan ureter. The 18x18 versions preserve the dominant organ silhouette and attachment cue. Color is helpful but not required: the black-and-white example remains identifiable by structure.

E. Expected usage level

Kidney is used in ordinary conversations about anatomy, hydration, urine, stones, laboratory results, dialysis, transplant, living donation, medication safety, school science, and family health. The five frequency screenshots required by Unicode are embedded below. Google Trends and Google Books compare kidney with Unicode's reference term elephant.

Google Search

Captured 2026-05-13. The result page reports about 211,000,000 results. Reproducible query: <http://www.google.com/search?q=kidney&hl=en&num=10&pws=0>

The screenshot shows a Google search for "kidney". The search bar at the top contains the word "kidney". Below the search bar, there are tabs for "All", "Images", "Videos", "Shopping", "News", "Short videos", "More", and "Tools". The "All" tab is selected. The search results show "About 211,000,000 results (0.16s)". The first result is "Human Kidney Anatomy" with two diagrams: "External View" and "Internal View". The "External View" diagram shows the kidneys in the human body, with labels for "Kidney", "Ureter", "Bladder", and "Urethra". The "Internal View" diagram shows the internal structure of the kidney, with labels for "Cortex", "Medulla", "Papilla", "Minor calyx", "Major calyx", "Renal pelvis", "Renal vein", "Renal artery", and "Hilum". Below the diagrams, there is a text description: "Kidneys are two bean-shaped organs, about the size of a fist, located on either side of the spine just below the rib cage. They filter roughly 37 gallons of blood daily to remove waste and extra water, maintaining fluid, salt, and mineral balance while producing urine. Key functions also include regulating blood pressure, stimulating red blood cell production, and managing bone health." Below this text, there is a section titled "Key Kidney Functions & Health" with a bullet point: "Filtration: Using millions of tiny units called nephrons, kidneys filter waste and excess water from the blood, which then travels to the bladder through ureters." To the right of the main text, there are several search results from "Cleveland Clinic", "National Kidney Foundation", and "National Institutes of Health (NIH)". At the bottom of the page, there is a section titled "People also ask" with four questions: "What are the first signs of a kidney problem?", "What is the best drink to flush your kidneys?", "What are the three early warning signs of a kidney?", and "What drinks are hardest on the kidneys?".

Google Video Search

Captured 2026-05-13. The result page reports about 66,000,000 results. Reproducible query: <https://www.google.com/search?tbm=vid&q=kidney&hl=en&num=10&pws=0>

The screenshot shows a Google search for 'kidney' with the 'Videos' tab selected. The search bar at the top contains the word 'kidney'. Below the search bar, there are navigation links for 'All', 'Images', 'News', 'Videos', 'Shopping', 'Books', and 'More'. A 'Tools' dropdown menu is open, showing options for 'Any duration', 'Any time', 'Any quality', 'All videos', 'Any source', and 'Advanced Search'. The search results list several videos related to kidney health. Each result includes a thumbnail image, a title, a brief description, and the source of the video. The results are as follows:

Google Trends - Web Search

Captured 2026-05-13 using Worldwide and 2004-present. Kidney is of the same order as elephant and reaches comparable or greater recent interest. Reproducible query: <https://trends.google.com/trends/explore?date=all&q=elephant,kidney>

Google Trends - Image Search

Captured 2026-05-13 using Worldwide and 2008-present. The graph shows sustained kidney image-search interest against elephant. Reproducible query: https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=elephant,kidney

Google Books Ngram Viewer

Captured 2026-07-09 using the English corpus, 1500-2022, and smoothing 3. Kidney exceeds elephant in recent published-book usage. Reproducible query: https://books.google.com/ngrams/graph?content=elephant%2Ckidney&year_start=1500&year_end=2022&corpus=en&smoothing=3

F. Completeness

Not applicable. Kidney is independently useful and is not proposed merely to complete a set of organs.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already representable

Kidney is not represented by an existing emoji. Bean cannot serve as a clear substitute in anatomical, donation, transplant, dialysis, testing, or medication contexts. General medical emoji identify care but not the organ.

B. Overly specific

Kidney is a primary organ and a broad everyday concept, not a particular disease, procedure, specialty, organization, campaign, or brand. Its uses span body anatomy, health, filtration, hydration, stones, donation, transplant, food language, and education.

C. Open-ended

This proposal does not request a complete anatomy taxonomy. Kidney is supported by its own frequency, multiple meanings, visual distinctiveness, and lack of an adequate substitute. Other organs can be judged independently on the same criteria.

D. Transient

Kidney anatomy, hydration, stones, disease, dialysis, transplant, donation, and kidney-shaped language are durable concepts rather than a temporary event or trend.

E. Faulty comparison

The proposal does not argue that kidney should be encoded merely because heart, lungs, or brain exist. Those emoji only demonstrate that anatomical organs can be legible at emoji scale. Kidney's case rests on its own expected usage and expressive gap.

Other Information

The singular name Kidney is concise and searchable. Essential design cues are one clearly organic maroon form, a medial indentation, and a short vessel or ureter cue that prevents the image from reading as food. Fine vascular detail is optional and should yield to legibility at 18x18.

Proposal for Emoji: Stomach

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-12

Identification

Suggested name: Stomach

Suggested keywords: digestion; gut; belly; abdomen; hunger; appetite; fullness; nausea; indigestion; reflux

Suggested category: People & Body - body-parts

Suggested sort location: Near anatomical heart, lungs, and brain in the body-parts subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm uses one bold J-shaped stomach silhouette with a smoothly joined inlet and a short rounded outlet. These cues distinguish it from food, a generic blob, or another solid organ. Vendors may simplify shading, but the curved hollow-organ body should remain recognizable.

I, Shuhan He, certify that these example images are original work created for this proposal, that I own all IP Rights in them, and that they contain no third-party artwork, logo, trademark, or text. I release the images under the CC0 1.0 Universal Public Domain Dedication and grant the rights required by the Unicode Emoji Proposal Agreement and License.

CC0 1.0: <https://creativecommons.org/publicdomain/zero/1.0/>

Factors for Inclusion

A. Multiple meanings

Stomach has established emotional and figurative meanings in addition to anatomy and digestion. Familiar expressions include butterflies in the stomach, a nervous stomach, an empty or strong stomach, and being unable to stomach something. These meanings support emotion, appetite, tolerance, and physical sensation without depending on a pun.

Cambridge Dictionary documents both butterflies in your stomach and the verb sense of stomach, meaning to accept or deal with something unpleasant:

<https://dictionary.cambridge.org/us/dictionary/english/butterflies-in-stomach>

<https://dictionary.cambridge.org/us/dictionary/english/stomach>

B. Use in sequences

Stomach can combine with existing emoji to create messages without standardized sequences:

- Stomach + fork and knife: hunger, meals, appetite, digestion, or fullness.
- Stomach + nauseated face: nausea, stomach bug, or upset stomach.
- Stomach + warning: stomach pain, food reaction, or urgent symptom.
- Stomach + pill or hospital: antacid, treatment, endoscopy, or digestive care.
- Stomach + butterfly: nervous anticipation or butterflies in the stomach.
- Stomach + brain or thought bubble: gut feeling or intuition.

C. Breaks new ground

Yes. No current emoji represents the stomach or digestion as an organ process. Food emoji show what is eaten; nauseated face shows a feeling; and hospital, pill, and syringe show care or treatment. None identifies the stomach itself. The proposal therefore adds a distinct digestive-organ concept with ordinary uses in food, sensation, emotion, education, and health.

D. Distinctiveness

The stomach's asymmetrical curved form, narrow inlet, rounded body, and outlet are recognizable in school diagrams and public health illustration. The example remains distinguishable in black and white and at 18x18 because recognition rests on silhouette rather than color or fine internal texture. It does not resemble anatomical heart, lungs, or brain.

E. Expected usage level

Stomach is used in everyday conversations about digestion, eating, hunger, appetite, fullness, nausea, stomach ache, indigestion, reflux, medication, endoscopy, family health, and school science. The five frequency screenshots required by Unicode are embedded below. Google Trends and Google Books compare stomach with Unicode's reference term elephant.

Google Search

Historical capture from 2020-08-31. The result page reports about 414,000,000 results. Reproducible query: <https://www.google.com/search?q=stomach&hl=en&num=10&pws=0>

Google Video Search

Historical capture from 2020-08-31. The result page reports about 160,000,000 results. Reproducible query: <https://www.google.com/search?tbm=vid&q=stomach&hl=en&num=10&pws=0>

Google Trends - Web Search

Historical capture from 2020-08-31 using Worldwide and the widest range then shown, 2004 through the capture date. Stomach exceeds elephant in average interest and rises substantially over the captured period. Reproducible query: <https://trends.google.com/trends/explore?date=all&q=stomach,elephant>

Google Trends - Image Search

Historical capture from 2020-08-31 using Worldwide and 2008 through the capture date. The graph shows sustained stomach image-search interest against elephant. Reproducible query: https://trends.google.com/trends/explore?date=all_2008&gprop=images&q=stomach,elephant

Google Books Ngram Viewer

Captured 2026-07-09 using the English corpus, 1500-2022, and smoothing 3. Stomach substantially exceeds elephant in recent published-book usage. Reproducible query: https://books.google.com/ngrams/graph?content=elephant%2Cstomach&year_start=1500&year_end=2022&corpus=en&smoothing=3

F. Completeness

Not applicable. Stomach is independently useful and is not proposed merely to complete a set of organs.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already representable

Stomach is not represented by an existing emoji. Food, nauseated face, hospital, and pill can imply related circumstances but cannot identify the organ, distinguish hunger from nausea, or express stomach-specific anatomy and care.

B. Overly specific

Stomach is a primary organ and an everyday concept, not a particular disease, procedure, specialty, organization, campaign, or brand. It covers digestion, hunger, fullness, symptoms, emotion, education, nutrition, and health.

C. Open-ended

This proposal does not request a complete anatomy taxonomy. Stomach is supported by its own frequency, multiple meanings, visual distinctiveness, and lack of an adequate substitute. Other organs can be judged independently on the same criteria.

D. Transient

Digestion, hunger, fullness, nausea, abdominal discomfort, and stomach-related expressions are durable across generations and are not tied to a temporary event or trend.

E. Faulty comparison

The proposal does not argue that stomach should be encoded merely because other organs exist. Its case rests on its own expected usage, broad meanings, recognizable silhouette, and expressive gap.

Other Information

The singular common name Stomach is concise and searchable. Essential design cues are an asymmetrical J-shaped hollow-organ body, a short joined inlet, and a rounded outlet. Fine anatomical detail is optional and should yield to legibility at 18x18. Vendors should avoid a form that reads primarily as food or a generic pink shape.

Proposal for Emoji: Liver

Submitter: Shuhan He, MD

Main point of contact: Shuhan He

Date: 2026-07-12

Identification

Suggested name: Liver

Suggested keywords: hepatic; anatomy; organ; metabolism; digestion; bile; alcohol; hepatitis; transplant; donation

Suggested category: People & Body - body-parts

Suggested sort location: Near anatomical heart, lungs, and brain in the body-parts subgroup.

Required Example Images

Size	Color	Black and white
18x18		
72x72		

The paradigm uses a full, asymmetrical wedge with a domed large lobe, a tapering smaller lobe, and a gallbladder tucked beneath the inferior edge. Vendors may omit the gallbladder if the liver remains recognizable. Fine surface anatomy is unnecessary at emoji scale.

I, Shuhan He, certify that these example images are original work created for this proposal, that I own all IP Rights in them, and that they contain no third-party artwork, logo, trademark, or text. I release the images under the CC0 1.0 Universal Public Domain Dedication and grant the rights required by the Unicode Emoji Proposal Agreement and License.

CC0 1.0: <https://creativecommons.org/publicdomain/zero/1.0/>

Factors for Inclusion

A. Multiple meanings

Not applicable. This proposal does not rely on a metaphorical or symbolic meaning. Its case rests on direct, high-frequency uses across anatomy, metabolism, digestion, testing, medication, donation, transplant, education, and food.

B. Use in sequences

Liver can combine with existing emoji to create messages without standardized sequences:

- Liver + test tube or chart: liver function test or laboratory results.
- Liver + pill: medication processing, side effects, or treatment.
- Liver + warning or alcoholic drink: liver risk or alcohol-related concern.
- Liver + people or heart: donation, transplant, recipient, caregiver, or support.
- Liver + hospital: hepatology visit, procedure, or inpatient care.
- Liver + plate or cooking pot: liver as food or cooking context.
- Liver + book or microscope: anatomy, school science, or research.

C. Breaks new ground

Yes. No current emoji represents the liver or hepatic anatomy. General medical emoji represent care, tests, or treatment; food and beverage emoji represent consumption; and anatomical heart, lungs, and brain represent different organs. None can identify liver function, liver testing, liver donation, transplant, or liver-specific health discussion. Liver therefore adds a distinct internal-organ concept.

D. Distinctiveness

The liver has a broad, wedge-like, asymmetrical silhouette with unequal lobes. The proposed paradigm adds a small gallbladder cue in color and a simple lobe division in black and white. It is wider and flatter than the stomach, has no paired symmetry like kidneys or lungs, and does not resemble anatomical heart or brain. The silhouette remains legible at 18x18 without text.

E. Expected usage level

Liver is used in ordinary conversations about anatomy, laboratory results, medication effects, alcohol, hepatitis, fatty liver, transplant, living donation, school science, animal liver as food, and family health. The five frequency screenshots required by Unicode are embedded below. Google Trends and Google Books compare liver with Unicode's reference term elephant.

Google Search

Historical capture from 2020-07-12. The result page reports about 391,000,000 results. Reproducible query: <https://www.google.com/search?q=liver&hl=en&num=10&pws=0>

Google Video Search

Historical capture from 2020-07-12. The result page reports about 85,500,000 results. Reproducible query: <https://www.google.com/search?tbm=vid&q=liver&hl=en&num=10&pws=0>

Google Trends - Web Search

Historical capture from 2020-07-12 using United States and 2004 through the capture date. Liver and elephant show comparable average interest in the captured period. This regional capture must be refreshed to Worldwide before filing. Reproducible query: <https://trends.google.com/trends/explore?date=all&geo=US&q=liver,elephant>

Google Trends - Image Search

Historical capture from 2020-07-12 using United States and 2008 through the capture date. The graph shows sustained liver image-search interest against elephant. This regional capture must be refreshed to Worldwide before filing. Reproducible query: https://trends.google.com/trends/explore?date=all_2008&geo=US&gprop=images&q=liver,elephant

Google Books Ngram Viewer

Captured 2026-07-09 using the English corpus, 1500-2022, and smoothing 3. Liver substantially exceeds elephant in recent published-book usage. Reproducible query: https://books.google.com/ngrams/graph?content=elephant%2Cliver&year_start=1500&year_end=2022&corpus=en&smoothing=3

F. Completeness

Not applicable. Liver is independently useful and is not proposed merely to complete a set of organs.

G. Compatibility

Not applicable. This proposal does not rely on a legacy carrier emoji or another encoded pictograph.

Factors for Exclusion

A. Already representable

Liver is not represented by an existing emoji. Hospital, pill, test tube, warning, food, and beverage emoji can show surrounding contexts but cannot identify the organ or distinguish a liver-specific message.

B. Overly specific

Liver is a primary organ and a broad everyday concept, not a particular disease, procedure, specialty, organization, campaign, or brand. Its uses span anatomy, metabolism, digestion, testing, medication, alcohol, donation, transplant, food, and education.

C. Open-ended

This proposal does not request a complete anatomy taxonomy. Liver is supported by its own frequency, breadth of direct uses, visual distinctiveness, and lack of an adequate substitute. Other organs can be judged independently on the same criteria.

D. Transient

Liver anatomy, function, testing, medication effects, alcohol, disease, donation, transplant, and food uses are durable concepts rather than a temporary event or trend.

E. Faulty comparison

The proposal does not argue that liver should be encoded merely because other organs exist. Its case rests on its own expected usage, breadth of direct uses, recognizable silhouette, and expressive gap.

Other Information

The singular common name Liver is concise and searchable. Essential design cues are a full, asymmetrical, lobed organ silhouette with a domed major lobe and tapering edge. A tucked green gallbladder or simple lobe division can improve recognition but is optional. Vendors should avoid excessive realism and preserve a clear outline at 18x18.
